# LICENSE DASHBOARD™

Software Recognition Service

Translate your data into a meaningful software list, helping you to remain compliant, optimize spend, and minimize your costs.

Does your inventory data give you insights into all software installed across your entire estate?

The challenge for software asset management (SAM) managers is making sense of lists of raw data gathered from multiple inventory tools, gaining a single version of the truth for what is installed across your estate – and critically whether it is licensable or not.

Our Software Recognition Service frees up your time and resources for business-critical tasks

Save time investigating and reconciling raw data

Software is categorized by our global team of License Dashboard data analysts, and unrecognized files and applications are matched, normalized, and classified by our specialists.

Ensure correct inventory results

All raw data instances are matched within License Dashboard's recognition database. Our analysts focus on the missing and unmatched signatures, using our cognitive in-house data normalization and recognition systems that update our master dictionaries daily with new applications.

Work with any inventory tool

Our Software Recognition Service cleanses and normalizes audit data from all inventory solutions, including License Dashboard Discovery.

Vastly increase the percentage of your recognized estate

A large proportion of unmatched raw data could be worthless legacy software, system files, or in-house applications. Filtering this out from your licensable estate will boost your overall discovered percentage within your SAM tool.

LD Web API

Do you have other systems that might benefit from this cleansed and normalized data? Find out how this and all the other information held within License Manager is readily accessed via our API.
